Beneficiary Satisfaction & User Experience Report

Descriptive Analysis of Beneficiary Feedback for the Engineering Playground Platform

Report date: 10 October 2026
Evidence base: 12 beneficiary evaluation responses

01 | Executive Summary

Across 12 submitted evaluations, the overall satisfaction item averaged 5.00/5, with 12/12 respondents selecting the highest rating (5/5). Across all 12 rating statements, 142/144 (98.6%) ratings were favorable (4 or 5). These findings indicate very positive self-reported experience among respondents, while remaining descriptive rather than representative of all potential users.

Evaluation responses	Overall satisfaction	Favorable ratings	Reported technical issues
12	5.00 / 5	98.6%	0 / 12

02 | Evaluation Design & Methodology

A post-experience, self-reported survey was analyzed descriptively. It includes 12 five-point agreement items, a multiple-selection activity question, two open-ended feedback prompts, and one question about technical problems. Means and favorable shares were computed directly from the recorded responses; 4 and 5 were classified as favorable. No individual names are reproduced.

Interpretation: This feedback measures reported perceptions of the experience; it does not independently validate technical reliability, learning gains, or performance on practical engineering tasks.

03 | Activities Used During the Experience

Activity	Respondents	Share of respondents
Circuit simulation	12	100.0%
Educational challenges	8	66.7%
Learning content and lessons	8	66.7%

Participants could select more than one activity; therefore, percentages do not sum to 100%.

04 | Satisfaction & Experience Indicators

Survey indicator	Mean / 5	Favorable / 12
Ease of finding sections and activities	5.00	12/12
Content organization and focus	5.00	12/12
Navigation without impactful technical difficulty	5.00	12/12
Clarity and appropriateness of learning content	4.83	11/12
Examples and activities supporting understanding	4.83	11/12
Self-reported confidence in circuit fundamentals	4.92	12/12
Connecting theory with practice via simulation	5.00	12/12
Challenges encouraging problem-solving	5.00	12/12
Interactive activities sustaining engagement	5.00	12/12
Perceived usefulness for engineering learning	4.92	12/12
Willingness to use for other engineering topics	4.83	12/12
Overall satisfaction	5.00	12/12

05 | Distribution & Technical Experience

Rating	Number of selections	Share
1	0	0.0%
2	0	0.0%
3	2	1.4%
4	4	2.8%
5	138	95.8%

All 12 respondents selected “No, I did not experience problems” in the technical-issue question. This indicates no reported technical problems within this respondent group, not proof that the platform is defect-free.

06 | Beneficiary Feedback — Original Arabic Comments

All substantive written responses are reproduced below in their original Arabic wording, including repeated responses. Entries consisting only of a period (.) are excluded as non-substantive. The survey recorded 11 substantive answers about appreciated aspects and 10 about suggestions or improvements. Respondent names are omitted.

Most appreciated aspects

التحديات وطريقة عرض المعلومات
سهولة المنصه
سهولة ايصال المعلومة و فهمها بشكل بسيط و جيد
شدني المنصه من ناحية المفاهيم الهندسية وسوف استخدم المنصه مراتٍ عديده
سهولة الوصول وتنوع الانشطة والمزايا في المنصة شي جميل
سلاسة المنصة وسهوله استخدامها
كل الجوانب متكامله و مميزه
سهولة القوائم
جميع الجوانب
السهولة و الوضوح
سهوله و وضوح

Suggestions and improvement requests

توسع المواضيع الهندسيه
لا يحتاج الى تحسينات

لايوجد اقتراح بالنسبه لي كل شيء ممتاز
المنصة سلسة ورهيبة سواء التسجيل او الاستخدام
لا شيء يذكر
لا شيء كل شيء مميز ولا يحتاج إلى تحسينات
اضافة مهام جديده

07 | Interpretation & Areas for Improvement

The results suggest strong perceived usability, engagement, and educational value among the respondents. The lowest item-level means, where present, identify relatively more varied opinions rather than necessarily poor performance. Written suggestions explicitly mention expanding engineering topics and adding new tasks. Broader challenge variation is an analyst recommendation, not a direct respondent request.

Most written responses were complimentary or stated that no changes were needed. This pattern should be interpreted in the context of a small sample with an undocumented recruitment method and predominantly ceiling-level scores.

08 | Conclusions & Recommendations

The available beneficiary evaluations provide encouraging evidence of high reported satisfaction with Engineering Playground. The platform was perceived positively by respondents, especially in its usability and interactive learning experience. This satisfaction evidence complements—but is distinct from—separate knowledge-assessment findings.

- Consider the requested expansion of engineering topics and addition of new tasks; evaluate challenge variation as a separate development option.
- Collect feedback from a larger, more diverse participant group and report the recruitment method.
- Pair future surveys with observed usability tasks and structured technical issue logs.

• Repeat the evaluation after platform updates and compare item-level results over time.

Prepared as a descriptive evaluation of the supplied beneficiary survey. Respondent-identifying information has been omitted.
